Work experience

AI Engineer | Globant | 26/02/2024 - Current | La Spezia, Italy

I began my career at Globant as a Java Developer, immediately taking on the role of team leader within a relatively large team by the company's standards, in a challenging client environment. This initial project lasted six months and the company was very satisfied with my performance. Following this experience, I was involved in major experimental initiatives in Artificial Intelligence. Thanks to my prior knowledge of Python, I was considered the ideal candidate to contribute to the development of several Proofs of Concept aimed at demonstrating the potential of this emerging technology. All projects have been highly successful, to the point that I am now introduced as an AI Engineer and serve as one of the key technical references in Italy for the integration of AI within process automation projects.

Some of the main technologies I have worked with include:

AWS and GCP services

Graph databases (Neo4j, Amazon Neptune)

Vector databases for RAG support (Redis, pgvector)

Spring Framework for Java development, including an experimental project with extensive use of Spring State Machine

Several modern Python libraries, such as FastAPI, Pydantic (including its AI module), LangChain, SQLAlchemy, Alembic, and Celery

Software Engineer | Lunitek srl | 02/09/2019 - 23/02/2024 | Sarzana, Italy

I worked on the development of firmware and software for integrated seismic and structural monitoring systems. Specifically, I used C and C++ to program microcontrollers implementing various device functions, such as power management and data acquisition from ADC boards or GPS receivers. On the software side, I primarily used Python with the ObsPy framework to handle seismic data and to develop both graphical and command-line applications for data analysis, providing customized solutions to clients. Over time, I also carried out projects not strictly related to monitoring, such as an intelligent solar-panel battery charger for boats and a GPS base station. In addition, for a research project funded by the Tuscany Region, I successfully coordinated a small development team (4 people).

Software Engineer | Callegari Srl | 19/11/2018 - 31/08/2019 | Parma

I designed and developed application software for a device featuring a touch screen and powered by an ARM-based board. The main technologies involved were C++ with Qt and QML for the graphical interface and core application, OpenCV and GStreamer for image processing, and Python with OpenCV for prototyping filters. The system ran on a custom Linux build that I created using the Yocto Project. I also took care of producing prototype enclosures using a 3D printer.

Software/Automation Engineer | Rimar SRL | 23/10/2017 - 16/11/2018

My main responsibilities included hardware configuration and software development for PLCs (primarily Siemens, occasionally Allen Bradley) and industrial Fanuc robots, for which I completed a certification course. I was also involved in the construction of machinery, assisting with the review of electrical schematics, as well as testing and commissioning automation lines at client sites. In addition, I developed small internal web applications—mainly using HTML5, jQuery, and Java—to streamline certain project management processes.

Junior Automation Engineer | PSA Italy | 22/05/2017 - 13/10/2017

I was responsible for developing and modifying PLC software (mainly Siemens and Allen-Bradley platforms) to control machinery, as well as adapting user panel interfaces according to client requirements. Once modifications were completed, I also performed electrical and functional testing on the machines and provided support to mechanical assemblers.

Analista/Programmatore Web | Zucchetti Spa | 01/03/2017 - 19/05/2017 | Collecchio(PR), Italy

I worked in the development team of a web-based management system for workplace safety in companies. The main tools used were proprietary development environments built on Java for server-side logic and JavaScript for client-side behavior. For database management, we worked with Microsoft SQL Server, PostgreSQL, and Oracle DB.

Part-time - Full stack software developer | Micratek | 15/10/2016 - 30/06/2017 | Parma, Italy

I developed web applications both on the server side (Java EE with Tomcat and some components in PHP) and on the client side (HTML, CSS, JavaScript, mainly dynamic pages using jQuery) to create a kind of small home PLC that could be easily configured by the user.

Education & Training

Bachelor’s Degree in Computer, Electronic and Telecommunications Engineering | Università degli studi di Parma | 01/09/2014 - 17/03/2017 | Parma, Italy

The degree program covered all aspects of information theory and, during the third year, focused primarily on computer science:

- Key mathematical tools
- Fundamentals of electronic and logic design
- Knowledge of major telecommunications systems
- Basics of control theory and automation
- Software development and design at all levels (including Android and iOS)
- Hardware development and design
- Elements of rational mechanics and mechanical design (thesis project)

Level in EQF 6 | Thesis: Design and implementation of the base joint for an anthropomorphic manipulator

Language Skills

Mother tongue(s): Italian

	Understanding		Speaking		Writing
	Listening	Reading	Spoken production	Spoken interaction	
English	B2	B2	B1	B1	B2
French	A2	A2	A1	A1	A1
